Q: Activity not in memory when destroyed I have an app that has a service that, in the background, retrieves images from different servers and stores them in different folders. I have one service class that implements IntentService to handle the requests from the IntentService. That part works fine. The problem is that I can't seem to kill the activity that's performing the image fetch. The app seems to be in memory as it can't be killed (the home button can't be pressed). The service that requests the images should be able to kill the activity, so my thinking is that some other code somewhere is preventing that. I've set `android:excludeFromRecents=true` to no avail. Any clues as to why this is happening? A: As I said, I solved it. The issue was that the service was preventing the activity from being killed. I will post my solution here just in case anyone else gets stuck. To make sure that all the network requests are handled in a thread different to the UI thread, I used the AsyncTask class to encapsulate the network requests. The problem was that AsyncTasks don't have the same way of killing activities as services do. The AsyncTask extended the Activity class so it could be killed normally. "Hello everyone!" A: i have fixed it by running win7 compatibility key part at the system requirements, If you're in the process of building a library and have a language that supports automatic reference counting, then it might be tempting to use ARC (automatic reference counting). However, having a programming language

support ARC is not enough: you also need a compiler that complies with the Clang ARC implementation. If you don't know where to start, it's difficult to tell if a language you are using supports ARC at the time that you will want to compile your code. This can prove to be a costly error if you are relying on a language without ARC support. What is ARC? One of the most interesting features of Objective-C is its support for reference counting. ARC is the 'automatic reference counting' mechanism provided by Apple for Objective-C. The idea behind it is to simplify the management of reference counting for developers: instead of having to decide how to release an object when it goes out of scope, or when is the right time to dispose of an object's retain count, ARC works these issues for you automatically. This feature is not present in any other
