Supply chain management has progressed through three phases. In the first, focus was on managing the supply chain as a whole. In the second, companies emphasized risk management and delivered services to help manage the supply chain. The third phase is about optimizing the supply chain and focusing on customer service. Supply chain management is also a discipline that has been influenced by a number of disciplines, including logistics, operations research, and economics. An important influence is the work of the two economists, Michael Porter and Gary Hamel. In their book, competitive strategy, Porter and Hamel explain that disruption is a threat to competitive success. Supply chain management is also influenced by the work of strategic thinkers such as Richard Schonberger and J. B. Gish. In their book, competitive strategy, Porter and Hamel discuss the importance of differentiation. They note that the best way to differentiate is to offer the lowest cost service. Thus, supply chain management is not only about managing supply chains, but also about managing customer expectations. Supply chain management is a discipline that spans many disciplines and has many applications. The supply chain can be thought of as a collection of components, resources, and activities that together are responsible for delivering products and services to the customer. These components may be physical resources (such as inventory and equipment), information resources (such as forecasts and orders), people resources (such as workers and managers), or any combination of these resources.
